

Table 9: Raltegravir (RAL) Interactions (also see prescribing information)

Class or Drug	Mechanism of Action	Clinical Comments
Antacids and other polyvalent cations [Krishna, et al. 2016; Calcagno, et al. 2015; Kiser, et al. 2010]	RAL chelates with cations, forming insoluble compounds that inactivate both drugs.	<ul style="list-style-type: none"> • Aluminum-magnesium hydroxide antacids: Concomitant use is contraindicated; use alternative acid-reducing agent. • Calcium carbonate antacids: <ul style="list-style-type: none"> – RAL HD once per day is <i>contraindicated</i>. – RAL 400 mg twice per day: No dose adjustment or separation is necessary. • Other polyvalent cations: Administer at least 2 hours before or 6 hours after.
Anticonvulsants	Coadministration with strong UGT1A1 inducers (phenytoin, phenobarbital, etc.) may decrease RAL concentrations.	Coadministration with strong UGT1A1 inducers is not recommended.
Rifabutin, rifampin, rifapentine	<ul style="list-style-type: none"> • Rifabutin: No clinically significant interactions are expected. • Rifampin: CYP3A4 induction reduces RAL bioavailability. • Rifapentine: Induction of metabolism may reduce RAL metabolism. 	<ul style="list-style-type: none"> • Rifabutin: No dose adjustments are necessary. • Rifampin: <ul style="list-style-type: none"> – When used concomitantly, dose RAL at 800 mg twice per day instead of 400 mg twice per day. – Do not use RAL HD. • Rifapentine: <ul style="list-style-type: none"> – For 900 mg once-weekly rifapentine and RAL 400 mg twice daily, no dose adjustments are necessary. – Do not coadminister RAL with once-daily rifapentine.
<p>Abbreviations: CYP, cytochrome P450; UGT, uridine diphosphate glucuronosyltransferase.</p> <p>No significant interactions/no dose adjustments necessary (see guideline section Drug-Drug Interactions by Common Medication Class): Common oral antibiotics; antihypertensive medications; anticoagulants; antiplatelet medications; statins; antidiabetic medications; acid-reducing agents; asthma and allergy medications; long-acting beta agonists; inhaled and injected corticosteroids; antidepressants; benzodiazepines; sleep medications; antipsychotics; nonopioid pain medications; opioid analgesics and tramadol; hormonal contraceptives; erectile and sexual dysfunction agents; alpha-adrenergic antagonists for benign prostatic hyperplasia; tobacco and smoking cessation products; alcohol, disulfiram, and acamprosate; methadone, buprenorphine, naloxone, and naltrexone; immunosuppressants; COVID-19 therapeutics; mpox treatments; gender-affirming hormones; ADHD medications and lithium.</p>
